

Sum of Five

Create a project named SumOfFive that finds the sum of five whole numbers. When the user clicks the *Enter* button, the numbers are entered one at a time using a loop and the InputBox function. Use an array with appropriate scope to store the whole numbers as they are entered. You may assume only whole numbers are entered. Then, when the user clicks the *Find Sum* button, a second loop is used to find and display their sum and the numbers, as shown.
