# Calculator

Write a program that allows the user to specify two numbers and then adds, subtracts, or multiplies them when the user clicks on the appropriate button. The output should include the type of arithmetic operation performed, the operands, and the result, as shown above. Note: When one of the numbers in an input textbox is changed, the previous result should be cleared.

- Use variables for all input and output values
- Clear results when the inputs change
- Use the Load event (p. 192) to display default inputs show above when the form opens
